

GridLayout in Java

GridLayout is a layout manager in Java AWT/Swing that arranges components in a rectangular grid of rows and columns. Every cell in the grid is the same size, and each component occupies one cell.

Syntax

```
GridLayout(int rows, int columns)
or
GridLayout(int rows, int columns, int hgap, int vgap)
```

Parameters

- rows – Number of rows.
- columns – Number of columns.
- hgap – Horizontal gap between components.
- vgap – Vertical gap between components.

Advantages

- Simple and easy to use.
- Automatically arranges components into rows and columns.
- All components are of equal size.
- Suitable for calculators, keypads, and forms.
- Resizes components automatically when the window size changes.
